AEP FROM ZERO • PART 1 • KNOW YOUR CUSTOMER (AEP)

EPISODE 06

AEP Batch Loaded 0 Rows? Partial Ingestion Fix

Why did your AEP batch load 0 rows? In this Adobe Experience Platform tutorial, Bloom's 500-row order file fails completely until partial ingestion and its error threshold set the blast radius, and 497 orders land. You will learn to read the Required fields and Identity fields counters instead of trusting auto-map's 14 of 14, decode MAPPER-3700, MAPPER-3701, MAPPER-3707 and INGEST-1555 in error diagnostics, and count rejected rows from the dataset rather than Records failed. We finish with

Previously: a green bar and a hovering cursor

- Last time: 14 of 14 mapped, all green
- Today: read the counters before Finish
- Two files: 500 customers, 500 orders
- One run fails with zero rows loaded
- The fix: set the blast radius

KEY IDEA

Auto-map said 14 of 14 mapped. Today Bloom learns why a green bar is a question, not an answer.

14 of 14 mapped is not 14 of 14 correct

Counter	Reads	What it means
Mapped fields	14 of 14	Every column found a home
Required fields	0 of 1	A required field is unmapped
Identity fields	0 of 1	No identity, so no profile

KEY IDEA

Mapped fields only counts columns that found a home. Required fields and Identity fields are the real gates before Finish.

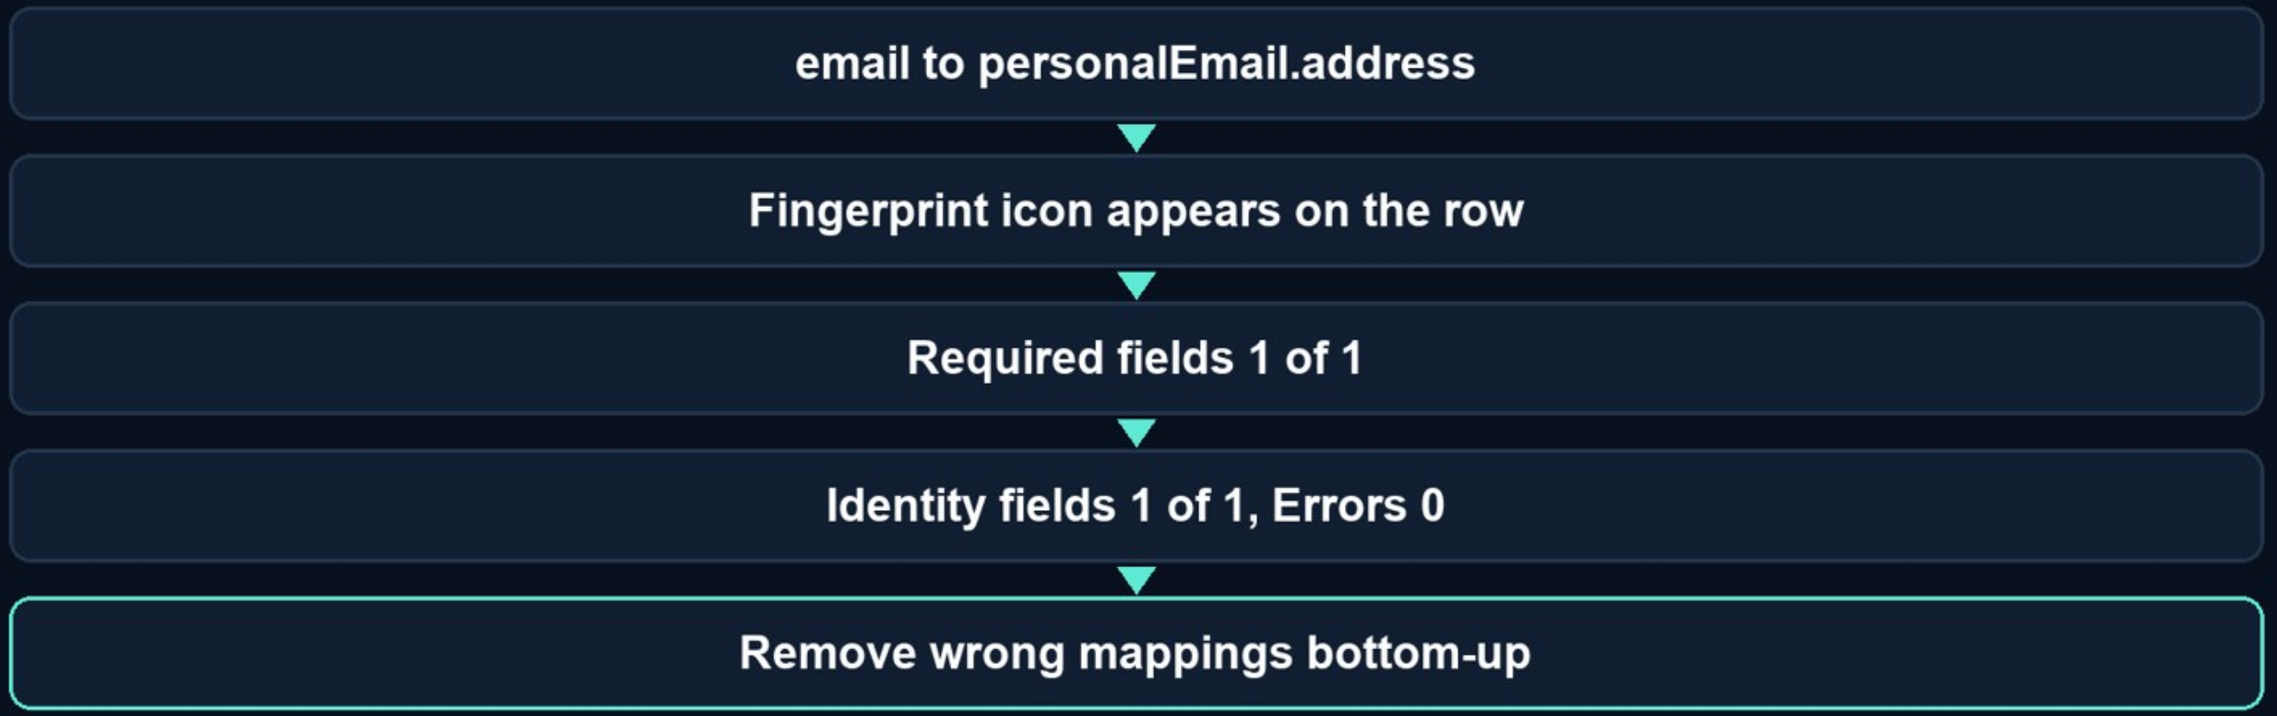

What auto-map actually did

CSV column	Auto-map chose	Why it is wrong
email	personalEmail.label	The label, not the address
phone	faxPhone.number	A mobile filed as a fax
loyalty_tier	billingAddress.stateProvince	A tier filed as a US state
loyalty_points	a map longitude field	A score as a coordinate
3 consent columns	email and phone status	Consent is not status

KEY IDEA

Auto-map filed a mobile as a fax, a tier as a state, points as a longitude, and consent as delivery status.

Fix the identity first

KEY IDEA

The identity mapping decides whether the batch runs at all. Every other mapping decides whether the data means anything.

Loyalty and consent go to _bloom

- Tier, points, join date: _bloom loyalty fields
- Email, SMS, push consent: _bloom consent fields
- Gold band feeds High-Value Loyalists
- Win-back needs email consent true
- Customers run: 500 ingested, 0 failed

KEY IDEA

Tier, points, join date and the three consent columns belong in Bloom's own _bloom fields, because audiences will depend on them.

The orders file fails differently

What AEP said	Cause	Fix
STRING cannot map to OBJECT	product_name aimed at an array	Delete that mapping
Unmapped path required: _id	No unique event ID mapped	Map order_id a second time

KEY IDEA

Naming schema fields after CSV columns made auto-map get both order identities right, but a type clash and a missing _id still blocked the run.

Failed: zero rows ingested

500 orders in the file

▼

Only 3 rows are actually bad

▼

Partial ingestion: OFF by default

▼

The whole batch is rejected

▼

Records ingested: 0

KEY IDEA

With partial ingestion off, a batch is all-or-nothing. A few bad rows can throw away every good row with them.

Error diagnostics: MAPPER versus INGEST

Order	Planted defect	Error raised
BLM-104200	empty timestamp	MAPPER-3707, INGEST-1555
BLM-109100	date 2026/13/45 25:99	MAPPER-3700, INGEST-1555
BLM-114700	price N/A	MAPPER-3701
BLM-119300	no bloom_id, no email	MAPPER-3707, INGEST-1555
BLM-123800	price -20.00	none: it loads

KEY IDEA

Preview error diagnostics names defects by column, with codes. MAPPER-37xx is usually the mapping's fault; INGEST-1555 is usually the data's.

Partial ingestion: set the blast radius

- Off by default: without it, all-or-nothing
- Switch: Enable partial ingestion
- Reveals Error threshold %, default 5
- Bloom re-run: 497 ingested, 7 failed
- Status Success in 3 min 14 s

KEY IDEA

Partial ingestion lets good rows land while bad rows are set aside, unless errors pass a threshold that defaults to 5 percent.

Who owns the threshold?

File	Threshold thinking
Marketing customer file	5 percent can be sensible
Finance reconciliation file	Much stricter
Who decides	A named business owner

KEY IDEA

An error threshold is a business decision. Five percent may suit a marketing file and be far too loose for finance. Someone must own it.

Seven errors, but only three bad rows

Number on screen	What it really means
Rows in the file: 500	The starting truth
Records ingested: 497	Rows that landed
Records failed: 7	Error instances, not rows
500 minus 497	Only 3 rows really rejected

KEY IDEA

Records failed counts error instances, not rows. The dataset row count is the honest number: 500 minus 497 means 3 rows were rejected.

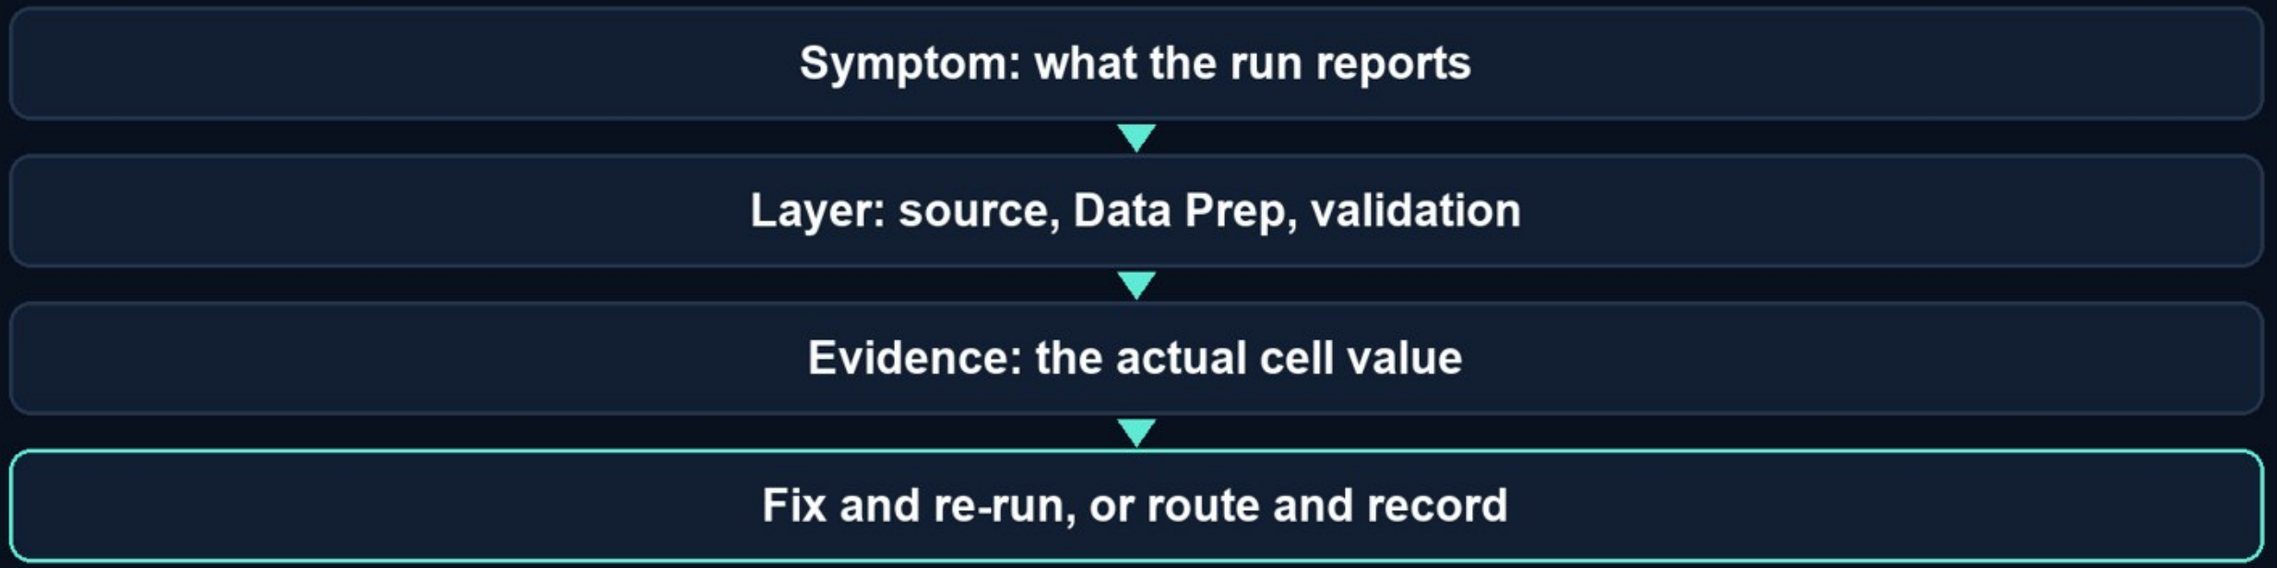

Loaded is not the same as right

Outcome	What it means
Rejected	Failed validation, never landed, logged
Loaded but wrong	Valid type, broken business rule
Who catches it	Platform: types. Bloom: business rules

KEY IDEA

The platform validates types, not business sense. A negative price is a valid number, so it loads. Business validation is Bloom's job.

Symptom, layer, evidence, fix or route

KEY IDEA

Every failure gets the same four steps: read the symptom literally, find the layer, look at the actual value, then fix it or route it.

What good looks like for a daily feed

- Idempotent: run it twice, same result
- Quarantined: bad rows set aside, with reasons
- Alerted: a person hears about failures fast
- Every run: count rows in the dataset

KEY IDEA

A trustworthy daily feed is idempotent, quarantines bad rows with reasons, and alerts a person the moment a run fails.

Interview corner

- “14 of 14 mapped is not 14 of 14 correct.”
- “Partial ingestion is not ‘ignore errors’.”
- “It is ‘set the blast radius’.”
- Proof: 3 rows rejected, 497 orders lost

KEY IDEA

Two lines that prove you have loaded real data: 14 of 14 mapped is not 14 of 14 correct, and partial ingestion sets the blast radius.

Recap, your question, and next time

- Read Required and Identity fields, not Mapped
- Partial ingestion off means all-or-nothing
- Records failed counts errors, not rows
- Types are checked; business sense is yours
- Next: identity stitching and Priya's fragments

KEY IDEA

Read the gates, set the blast radius, count rows in the dataset. Next: how many customers does Bloom actually have?
