AEP FROM ZERO • PART 1 • KNOW YOUR CUSTOMER (AEP)

EPISODE 09

AEP 'No Profiles Found'? Debug an Empty Profile

Seeing No profiles found in Adobe Experience Platform after a batch that succeeded? In this AEP troubleshooting tutorial, Bloom's 500 customers land in the data lake and the identity graph but never reach the Real-Time Customer Profile. You will learn the three destinations model, the four configuration checks, and how to read Monitoring, Batch end-to-end with the only ingest failures filter cleared, including the Records in Profile and New profile fragments columns. We finish with why Profile

Previously: No profiles found

- Last time: merge policies, Dallas versus Austin
- Lookup by email: No profiles found
- Today: rule out causes in a fixed order
- Find the one screen that answers it
- Know when to stop and escalate

KEY IDEA

Every build step reported success, yet the profile store says Priya does not exist. Today Bloom learns to diagnose instead of guess.

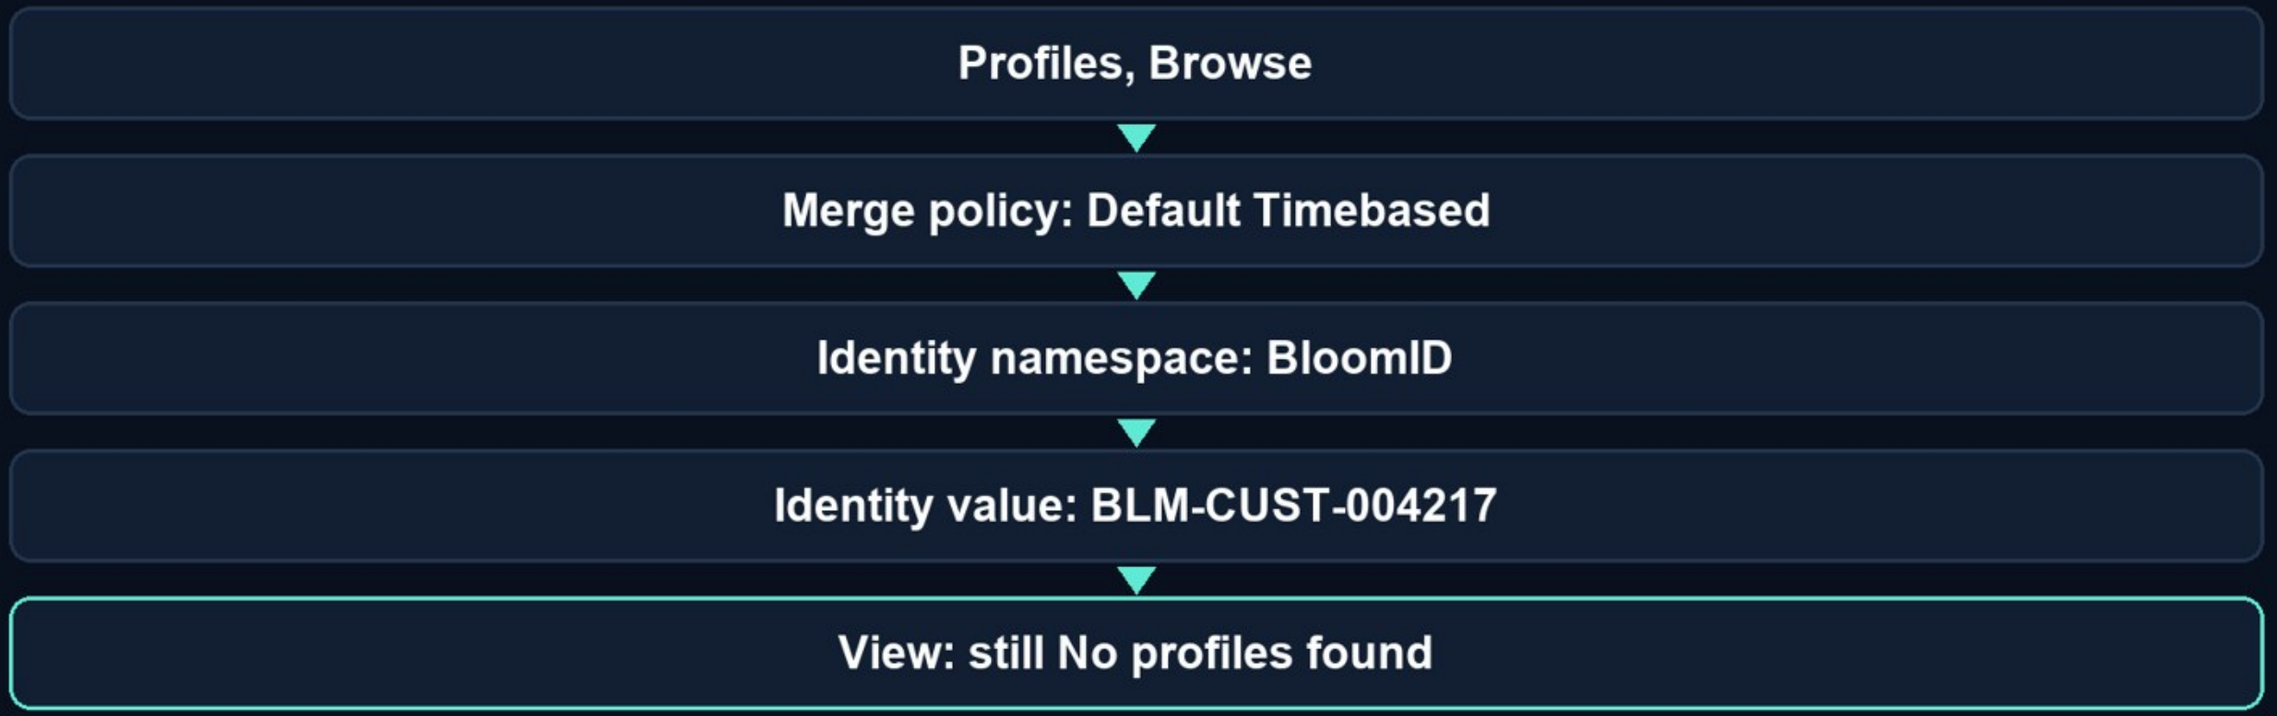

Everything green, nobody home

What Bloom built	What the screen says
Customer and order batches	Success
Bloom Customers and Bloom Orders	Enabled for Profile
Customer schema in the union schema	Present
Priya in the profile store	No profiles found

KEY IDEA

When everything reports success and the business result is missing, what you do in the next ten minutes is the job.

Cheap check one: a second namespace

KEY IDEA

Look the same person up by a different identity. If one namespace fails and another finds her, it was a lookup mistake, not a platform problem.

Union schema and the inherited toggle

Check	Where and what
Schema in Profile?	Profiles, Union Schema
Class to choose	XDM Individual Profile
Dataset enabled now?	New dataflow: toggle inherited, on
Result at Bloom	Both ruled out

KEY IDEA

The union schema proves a schema contributes to Profile. A new dataflow's inherited Profile toggle proves the dataset is enabled right now.

The batch, and a week-old licence page

- Batch: 500 received, 500 ingested, 0 failed
- Status Success, No errors
- License usage: read Last collected on first
- Bloom's licence page was a week stale
- Profiles Overview updates on a daily cycle

KEY IDEA

Read the batch itself, then the licence page, but check its Last collected on date first. Evidence must be live, not days old.

One file, three destinations, three gates

Destination	Its gate	Where you see it
Data lake	The row is valid	Records in dataset
Identity graph	Identity declared, mapped	Identity records stitched
Profile store	Profile on, identity resolves	Records in Profile

KEY IDEA

A batch fans out to the data lake, the identity graph and the profile store. Each has its own gate, so lake success says nothing about Profile.

The four configuration checks

1. Schema: Enabled for Profile
2. Schema declares an identity
3. Mapping: Identity fields 1 of 1
4. Dataset on, then re-ingest

Proof: New profile fragments above 0

KEY IDEA

Schema enabled, identity declared, identity mapped 1 of 1, dataset enabled and re-ingested. Necessary checks, but not always sufficient ones.

Monitoring, Batch end-to-end: clear the filter

Column	What it proves
Records in dataset	The data lake has the rows
New profile fragments	New profile records it created
Existing profiles	Existing profiles it updated
Identity records stitched	Identity links the graph formed
Records in Profile	Rows queryable in the profile store

KEY IDEA

Batch end-to-end shows lake, identity and Profile side by side. Clear the only ingest failures filter, then read Records in Profile.

Bloom's row: green, green, blank

- Records in dataset: a green 500
- Identity records stitched: green
- Records in Profile: blank, on every batch
- Lake yes, graph yes, profile store no
- Copy the row exactly, with its batch ID

KEY IDEA

Records in dataset was a green 500 and identities were stitched, but Records in Profile was blank on every batch. The data stopped before Profile.

It is just lag: a guess, not a diagnosis

Reassurance	Diagnosis
“It is just lag”	“Here is the test that decides it”
Cannot be proven wrong	A result can prove you wrong
Feels kind today	Gets the problem fixed

KEY IDEA

Adobe publishes no time for batch data to reach Profile, so “wait longer” proves nothing. A diagnosis names a test that could prove you wrong.

Profile enablement is not retroactive

KEY IDEA

Data loaded before Profile was switched on stays in the lake and never becomes a profile. Fix the setting, then load the data again.

The re-ingest test, and the whole sandbox

Sources, Local file upload, Add data

▼

Existing dataset: Bloom Customers

▼

Profile dataset: on, inherited

▼

Same file, same mapping, Finish

▼

Success: 500 in, 0 failed, 1 min 39 s

▼

Records in Profile: still blank

KEY IDEA

The re-ingest succeeded in 1 minute 39 seconds and Records in Profile stayed blank. Profiles Overview said no data for the entire sandbox.

Stop rebuilding: know when to escalate

- Schema enabled and present in the union
- Identity declared, mapped; dataset toggle on
- Batch succeeded; lake and identity green
- A re-ingest reproduces the blank exactly
- Then stop, and escalate with evidence

KEY IDEA

When every layer you control is proven correct and a re-ingest reproduces the fault, stop. It is a platform-level condition: escalate it.

Writing the evidence chain

- What we checked, in order
- Decisive row: Records in Profile blank
- What we ruled out, and how
- Attach: the batch ID and the dataset ID
- The ask: restore profile ingestion

KEY IDEA

An escalation note lists what you checked, the decisive Monitoring row, what you ruled out, the batch and dataset IDs, and what you need.

Interview corner

- “The lake received it.”
- “The identity graph received it.”
- “The profile store did not.”
- “Here is the row that proves it.”

KEY IDEA

“The lake received it, the identity graph received it, the profile store did not. Here is the row that proves it.”

Recap, your question, and next time

- Ingestion success is not profile success
- Clear the filter; read Records in Profile
- Enablement is not retroactive: re-ingest
- Proven build, fault reproduces: escalate
- Next: Priya appears, then the relaunch five

KEY IDEA

Three destinations, one decisive screen, re-ingest after enabling, escalate with evidence. Next: Priya appears, and Bloom builds audiences.
