AEP FROM ZERO • PART 3 • PROVE WHAT WORKED (CJA)

EPISODE 28

CJA Segments and Calculated Metrics Tutorial

CJA segments and calculated metrics explained from zero. Learn why Customer Journey Analytics renamed filters to segments in April 2025, how the person, session and event segment containers change your numbers, and when a quick segment is enough versus a saved segment. Understand CJA segment vs audience in AEP: segments explain, audiences act. Then build an average order value calculated metric with a Title, External ID, Currency format and Preview, and avoid the Create metric

Previously: a table that read zero

- Last time: first Workspace project, saved by hand
- A table of zeros, fixed by the date range
- No value: a tracking gap, not a channel
- Today: are Gold members actually worth more?
- Two tools: segments and calculated metrics

KEY IDEA

Last time Kavya built her first Workspace project. Today Anjali's question four needs two new tools: a segment and a calculated metric.

Question four: is Gold worth more?

Loyalty band	Orders	Revenue
Gold	300	23,400 dollars
Silver	420	23,100 dollars
Bronze	520	19,760 dollars

Relaunch fortnight, Bloom's fictional sample data

KEY IDEA

Revenue by loyalty band makes Gold and Silver look tied. The fair test is revenue per order, defined once and used by everyone.

CJA filters renamed to segments

- April 2025: CJA filters became segments
- Why: to match Adobe Analytics
- Older pages and videos still say filters
- Search filters are still called filters
- A segment narrows a report: people, sessions or events

KEY IDEA

In April 2025 CJA renamed filters to segments, to match Adobe Analytics. Search filters are still called filters. A segment narrows a report.

Segment containers: person, session, event

Container	What it keeps when the rule is true
Person	Every session and event of those people
Session	Only the sessions where the rule held
Event	Only the events that match the rule

KEY IDEA

A segment's container decides what it keeps when its rule is true: whole people, only the qualifying sessions, or only the qualifying events.

One rule, three containers: Priya's evening

Rule: a cart add exists	What survives for Priya
Person container	All her visits, the 54-dollar order too
Session container	Only visits with a cart add
Event container	Only the cart add, which has no revenue

KEY IDEA

The rule 'added to cart' keeps Priya's whole history at Person level, only her cart visits at Session level, and only the cart event at Event level.

Kavya's quick segment for Gold

Segment icon at the top of the panel

▼

Quick segment builder opens

▼

Include, scope Person

▼

Rule: loyalty band equals Gold

▼

Name fills itself in from the rule

▼

Panel counts Gold customers only

KEY IDEA

A quick segment is built at the top of a panel, without the Segment Builder: one rule, loyalty band equals Gold, at Person scope.

Quick segment or saved segment?

	Quick segment	Saved segment
Conditions	At most 3	One or more, And or Or
Nesting, sequences	Not allowed	Allowed, with Then
Who can use it	This project only	Component list, reusable
Built in	Top of the panel	Segment Builder

KEY IDEA

Quick segments allow at most three conditions, no nesting or sequences, and stay in their project. Save a proper segment when others depend on it.

Segments explain; audiences act

	CJA segment	AEP audience
Lives in	Customer Journey Analytics	Experience Platform
Its job	Narrows a report	Feeds journeys, destinations
Sends anything?	Never	Yes, through AJO or activation
Bloom example	Gold band customers	High-Value Loyalists

KEY IDEA

A CJA segment narrows analysis and sends nothing. An AEP audience is a living rule that journeys and destinations act on.

Why revenue per order needs one definition

- Old Bloom: each team divided its own way
- A typed rate breaks the first time you segment it
- Calculated metric: one saved formula, one definition
- Divides again in every row, segment and breakdown
- Revenue per order is average order value

KEY IDEA

Ratios such as average order value belong in calculated metrics, so every project uses one definition and it divides correctly in every row.

The shortcut: Create metric from selection

Table columns: Orders, then Revenue

▼

Click Revenue, Ctrl-click Orders

▼

Right-click a selected header

▼

Create metric from selection

▼

Choose Divide

▼

New column: zero on every row

KEY IDEA

Workspace can build a ratio without the builder: select two metric headers, right-click, Create metric from selection, then Divide.

Why my CJA metric divided the wrong way

Band	Orders over Revenue	Revenue over Orders
Gold	about 0.013	78 dollars
Silver	about 0.018	55 dollars
Bronze	about 0.026	38 dollars

Wrong way: tiny values shown as zero, and the ranking reversed

KEY IDEA

Create metric from selection follows the table's column order, not your click order. Orders then Revenue gives Orders divided by Revenue.

Build an average order value calculated metric

Components, then Create metric

▼

Title: Revenue per order

▼

External ID: your own clean ID

▼

Format Currency, 2 decimal places

▼

Definition: Revenue, then Orders

▼

Read Summary and Preview, then Save

KEY IDEA

In the builder: a Title, an External ID, Currency format, then Revenue divided by Orders. Check Summary and Preview, which covers 90 days.

Bloom's answer: 78, 55 and 38 dollars

Band	Orders	Revenue	Per order
Gold	300	23,400 dollars	78 dollars
Silver	420	23,100 dollars	55 dollars
Bronze	520	19,760 dollars	38 dollars
All bands	1,240	66,260 dollars	about 53 dollars

Relaunch fortnight, Bloom's fictional sample data

KEY IDEA

Revenue per order by band: Gold 78 dollars, Silver 55, Bronze 38. Revenue alone hid the gap; one shared metric made it plain.

Worth more, or made more? The honest caveat

- Gold spends more per order: that is association
- It does not prove the programme caused it
- Possible confounder: big spenders reach Gold faster
- Proof needs a fair comparison and a test
- Say what you know, and what would prove the rest

KEY IDEA

Gold spends more per order, but that is association, not proof that the loyalty programme caused it. Proving cause needs a comparison and a test.

Interview corner

- Segments explain; audiences act
- Container decides: people, sessions or events
- Quick segments explore; saved segments are shared
- Ratios live in one calculated metric
- Read the column name before you trust it

KEY IDEA

Segments explain; audiences act. And ratios belong in calculated metrics, so every team uses one definition.

Recap, your question, and the revenue fight

- Segments narrow analysis; audiences act
- Container: person, session or event, from the question
- Quick to explore; saved when others depend on it
- Revenue per order: Gold 78, Silver 55, Bronze 38
- Next: attribution models, and a referee

KEY IDEA

Segments explain and audiences act; the container decides what a segment keeps; ratios live in one calculated metric. Next: attribution.
