AEP FROM ZERO • PART 3 • PROVE WHAT WORKED (CJA)

# EPISODE 32

## Adobe Analytics vs Customer Journey Analytics

Adobe Analytics vs Customer Journey Analytics (CJA): what actually changes when a team moves from Adobe Analytics to CJA? This episode maps the main Adobe Analytics concepts to CJA: hit, visit and visitor become event, session and person, report suites become data views, eVars and props give way to schema fields, classifications become lookup datasets, customer attributes become profile datasets, and processing and VISTA rules become Data Prep and derived fields. You will learn what an

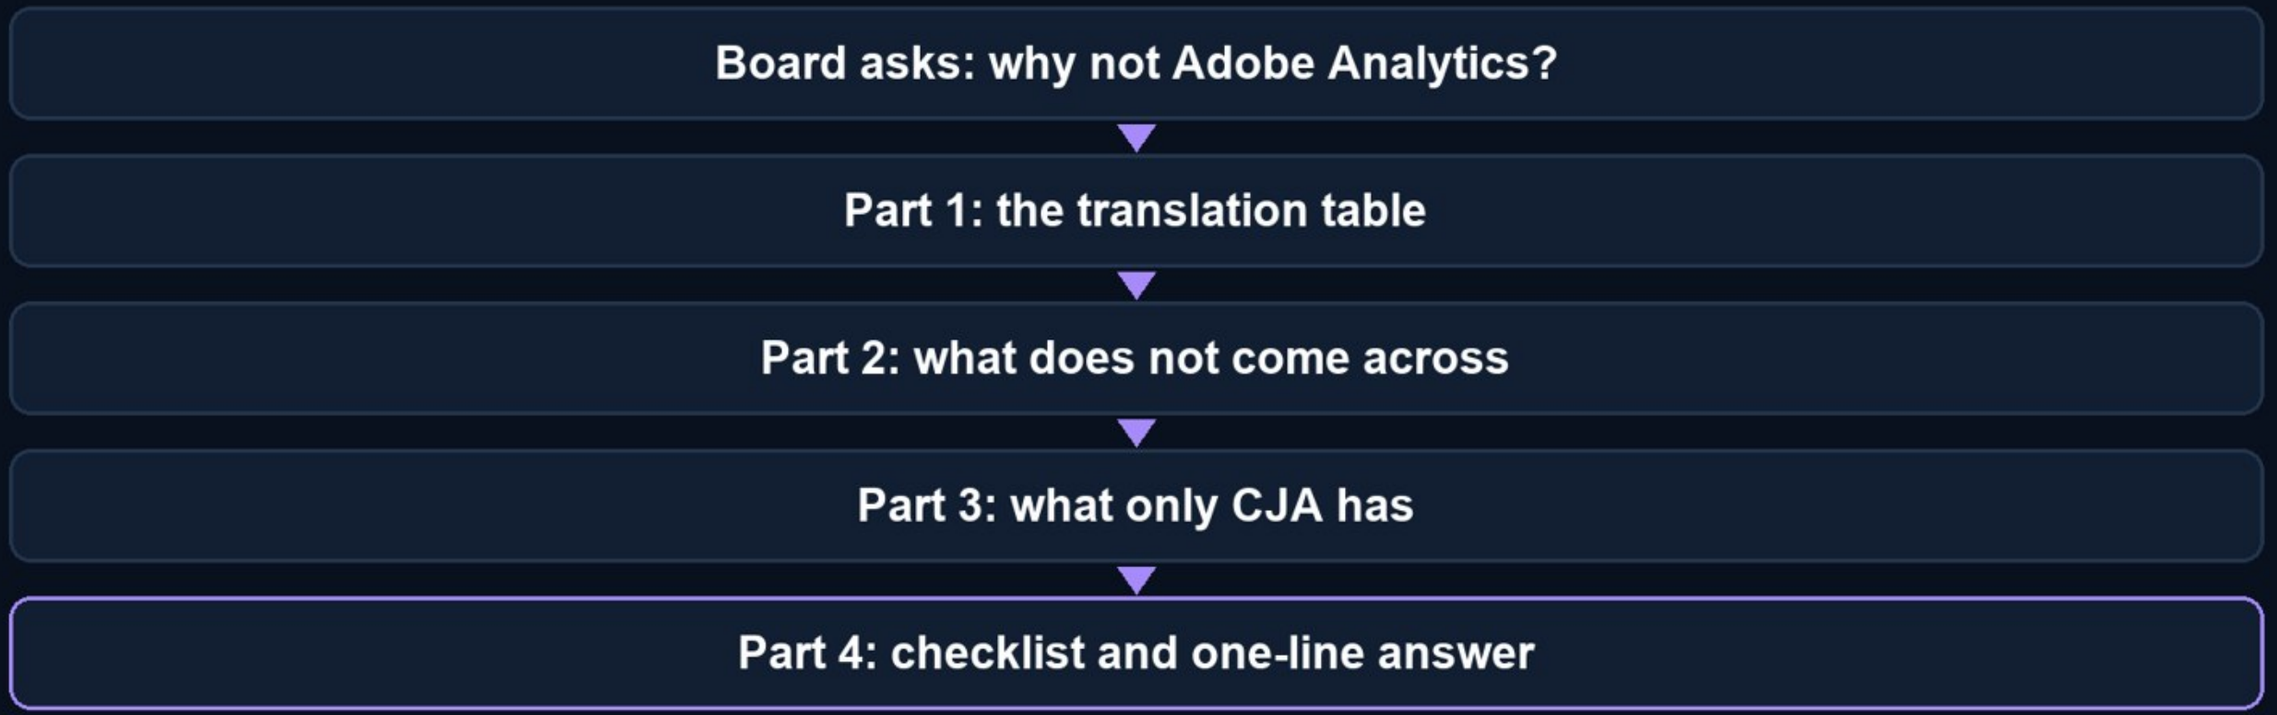

# Previously: the loop is closed

- Last time: Checkout Leakers - Mobile published to AEP
- Checkout Rescue picked them up through Read audience
- Anjali's mobile scorecard lands Mondays at eight
- Today: Adobe Analytics versus CJA, one honest memo
- Translate, list the gaps, name what only CJA has

KEY IDEA

Bloom closed the loop last time. Today a board member asks why Bloom did not simply buy Adobe Analytics, and the team owes an honest answer.

# Two Adobe products, one honest memo

KEY IDEA

Adobe Analytics is a different, older Adobe product. Many companies run it today and are moving to CJA, so 'what changes?' is a real job question.

# Adobe Analytics vs CJA: what really changes?

| Adobe Analytics | Customer Journey Analytics |
| --- | --- |
| **One report suite, mainly web data** | Dataset-based: any AEP dataset |
| **Hits, visits and visitors** | Person-based, across devices |
| **Settings applied at collection** | Settings applied at report time |
| **A change affects new data only** | Retroactive: the past changes too |

KEY IDEA

Adobe Analytics reports mainly on web data, with variable settings applied at collection. CJA joins any dataset to a person and applies settings at report time.

# Hit, visit, visitor: event, session, person

| Adobe Analytics | CJA | Priya's evening |
|---|---|---|
| **Hit** | Event | Her 7:52 PM order row |
| **Visit** | Session | One stretch of activity |
| **Visitor** | Person | Phone and laptop, one email |
| **Entries and Exits** | Session Starts and Ends | Where a session began, ended |

KEY IDEA

The hit, visit and visitor containers are renamed event, session and person. Entries and Exits become Session Starts and Session Ends.

# What replaces eVars in CJA?

- Report suite becomes data view, with more controls
- Adobe Analytics: up to 250 eVars and 75 props
- CJA: no eVars or props; any schema field will do
- Unlimited dimensions and unique values
- Attribution and expiration move into the data view

KEY IDEA

Report suites become data views, and eVars and props no longer exist. Any schema field can become a dimension, with no unique-value limits.

# Kavya's slip: an eVar is not a derived field

| Adobe Analytics eVar | In CJA |
|---|---|
| **Kavya's draft: a derived field** | Rohan: an ordinary schema field |
| **Attribution applied at collection** | Attribution applied at report time |
| **A change affects new data only** | A change rewrites the past too |
| **One setting per variable** | Several data views, several versions |

KEY IDEA

An eVar maps to an ordinary schema field, not a derived field. Its old settings are now applied at report time, so changes rewrite the past.

# Classifications and customer attributes

| Adobe Analytics | CJA | In Bloom 360 |
|---|---|---|
| **Classifications** | Lookup dataset | 200-product catalogue |
| **Joined by** | Key and Matching key | The product code, or SKU |
| **Customer attributes** | Profile dataset | The customer profile |
| **Joined by** | The person ID | The email |

KEY IDEA

Classifications become lookup datasets joined by a Key and a Matching key. Customer attributes become profile datasets applied to a person's events.

# Processing and VISTA rules: where they go

| Adobe Analytics rule | Where it goes now |
|---|---|
| **Processing rules** | Data Prep, or a derived field |
| **VISTA rules** | Data Prep, or a derived field |
| **Marketing channel processing rules** | Data Prep, or a derived field |
| **Journeys need the clean value too** | Data Prep, at the door |
| **Only reports, and the past too** | Derived field, at report time |

KEY IDEA

Processing rules, VISTA rules and marketing channel rules become AEP Data Prep at the door, or CJA derived fields at report time.

# Can you migrate Adobe Analytics segments?

List every segment and metric in use

▼

Write each definition in plain words

▼

Rebuild it on CJA schema fields

▼

Compare old and new on one window

▼

**Explain every gap, then switch over**

KEY IDEA

Existing Adobe Analytics segments and calculated metrics are not compatible with CJA. Inventory them, rebuild them, and reconcile them.

# What does not come across

| Adobe Analytics feature | In CJA, as of 2026 |
|---|---|
| **Activity Map** | Not supported, not yet planned |
| **Contribution analysis** | Not supported, not yet planned |
| **Hourly alerts** | Daily, weekly or monthly only |
| **Segments, calculated metrics** | Must be rebuilt |
| **Sharing projects with Analytics** | Only between CJA users |

KEY IDEA

Activity Map and Contribution analysis are not supported and not yet planned. Hourly alerts become daily, weekly or monthly ones.

# What only CJA has, and Bloom's questions

| Only in CJA | The Bloom question it answers |
|---|---|
| **Journey canvas** | How do new customers really move? |
| **Experimentation analysis** | Did Cart Rescue beat its holdout? |
| **Forecasting** | What might next fortnight look like? |
| **SQL access, BI Extension** | Can finance use the same revenue? |

KEY IDEA

Journey canvas, Experimentation analysis, Forecasting and SQL access are CJA-only. Name each with the Bloom question it would answer.

# Rohan's checklist for Analytics teams

1. Inventory suites, segments, alerts
2. Translate every term with the table
3. Choose the person ID and stitching
4. Rebuild segments and metrics
5. Reconcile old and new numbers
6. Write down what is lost, and why

KEY IDEA

Moving from Adobe Analytics? Inventory, translate, choose the person ID, rebuild, reconcile, and write down what you lose.

# Interview corner

- Person-based: phone and laptop become one person
- Dataset-based: journey steps beside orders and profile
- Retroactive: Lowercase merged 150 and 30 into 180
- Then the honest part: what must be rebuilt
- Under a minute, one example per word

**KEY IDEA**

Person-based, dataset-based, retroactive: three words, one example each, and you can answer Adobe Analytics versus CJA in under a minute.

# Recap, your question, and Act Four

- Hit, visit, visitor become event, session, person
- Report suites become data views; no eVars or props
- Lookups, profile datasets, Data Prep, derived fields
- Rebuild segments; no Activity Map or hourly alerts
- Next: Act Four, AI Assistant and verification

KEY IDEA

Translate the terms, admit the gaps, name what only CJA has. Act Three closes; next, an AI colleague that is sometimes confidently wrong.
