AEP FROM ZERO • PART 1 • KNOW YOUR CUSTOMER (AEP)

EPISODE 13

AEP Data Governance: DULE Labels and Policies

What are data usage labels (DULE) in Adobe Experience Platform, and why didn't your AEP governance policy block anything? In this AEP data governance tutorial, Bloom labels its phone field with contract label C2, discovers that every shipped data usage policy is Disabled, enables the 3rd party export restriction policy with Legal's sign-off, and meets a policy violation at activation. You will learn labels, marketing actions and policies in one sentence, the five label categories, how to fix a

Previously: a phone number on the list

- Last time: one tag in, two audiences ready to go
- Mapping: hashed email, loyalty band, phone flagged
- Then Legal stopped at the phone number
- Today: labels, marketing actions, policies
- And privacy: access and delete requests

KEY IDEA

Bloom's agency activation stalled on one field. Today: how a platform can refuse a restricted export, and how a request to be forgotten is honoured.

Why Legal wants a wall, not a memo

Question	Process document	Policy in the platform
Who enforces it?	A person who remembers	The platform, every time
2 AM on a Friday?	Maybe	Still refuses
Next year's activations?	Only if someone reads it	Covered automatically

KEY IDEA

A rule in a document depends on someone remembering it. A policy in the platform refuses every time, for everyone, including future activations.

Data usage labels: stickers on fields

- Label: what a field IS, a sticker on the field
- Marketing action: what you WANT to do
- Policy: which combination is BANNED
- Labels describe, actions intend, policies enforce
- Only an enabled policy blocks anything

KEY IDEA

A label says what a field is, a marketing action says what you want to do, and a policy says which combination is banned. Only the policy blocks.

The Labels tab and its warning

Reads labels	What it decides
Governance policies	Can this data go to a destination?
Consent policies	Can this profile join an audience?
Access policy	Which roles can see this field?

KEY IDEA

The Labels tab opens with a Label usage dialog: governance policies, consent policies and access policy all read labels. Labels are not documentation.

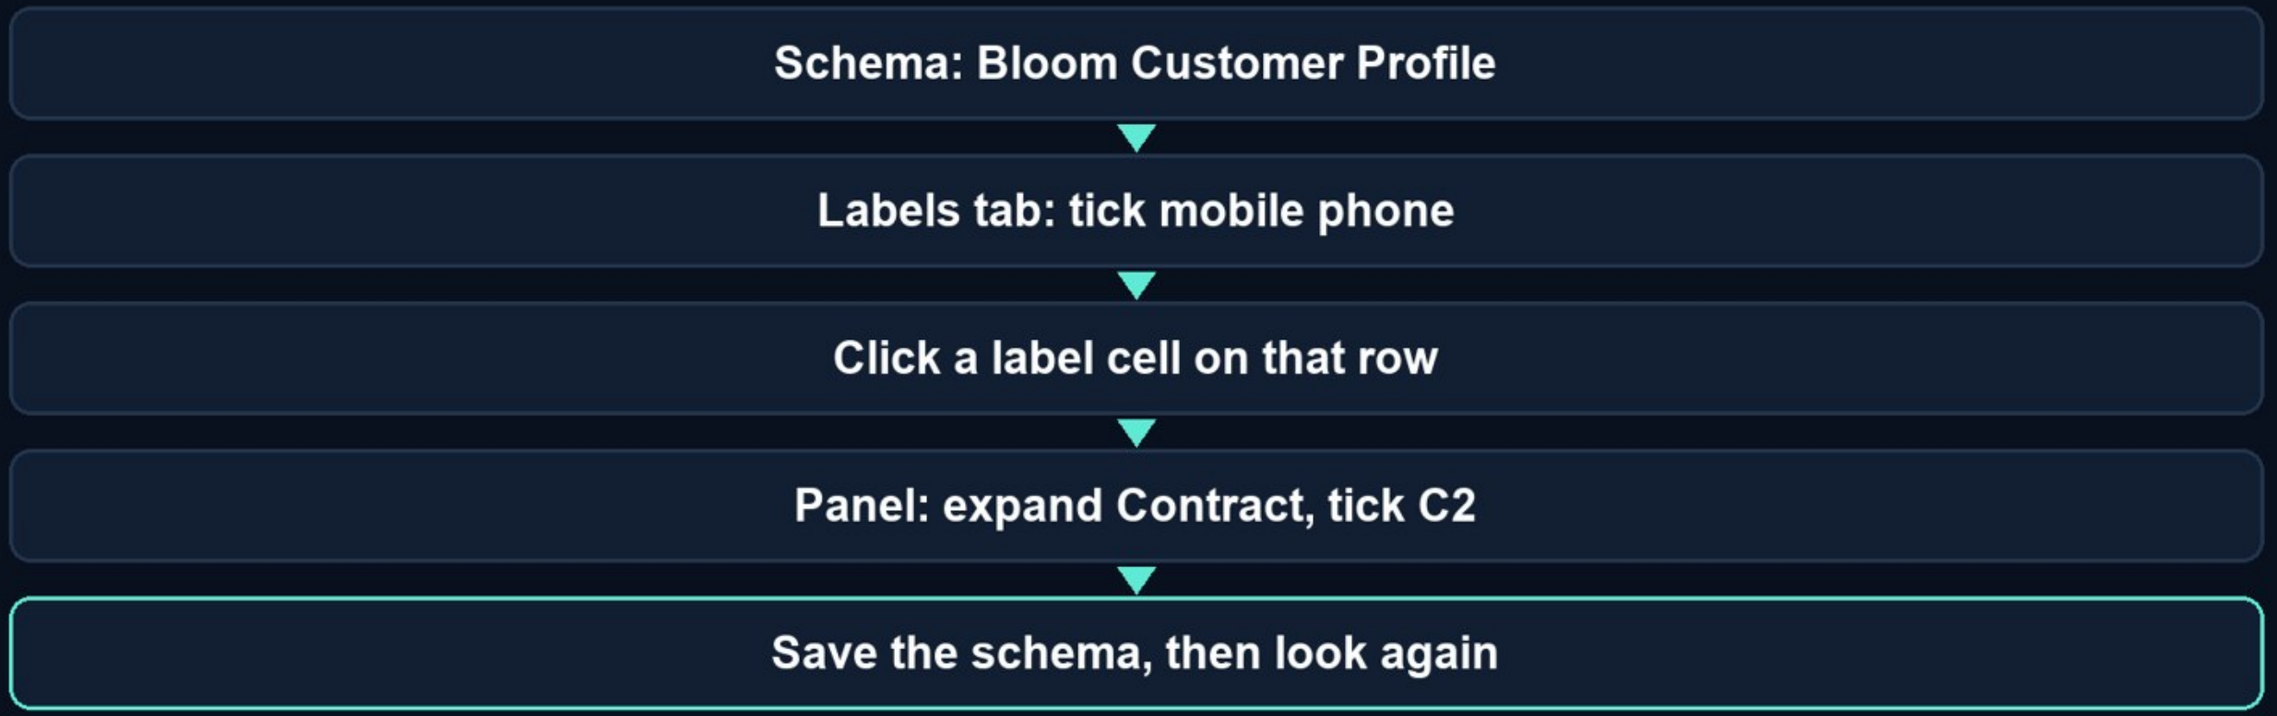

Five label categories

Category	What it describes
Identity	Identifies a person, directly or not
Sensitive	Sensitive data, such as location
Contract	Contract limits, labels C1 to C12
Partner ecosystem	Limits from data-partner agreements
Custom	Your organisation's own labels

KEY IDEA

Labels come in five categories: Identity, Sensitive, Contract, Partner ecosystem and Custom. Policies act most often on the Contract labels, C1 to C12.

Labelling Bloom's phone field C2

KEY IDEA

Tick the field, open a label cell, expand Contract, tick C2, then save the schema. Labels are part of the schema, so they need a schema save.

Marketing actions: the verb

- Policies, Marketing actions: Adobe's shipped verbs
- For example Export to Third Party, Data Export
- Locked by Adobe; add yours with Create marketing action
- Destinations declare the actions they perform
- Bloom's agency destination: Export to Third Party

KEY IDEA

Marketing actions say what you intend to do with data. Adobe's are locked but you can add your own, and each destination declares the actions it performs.

Every shipped policy is switched off

Shipped policy	Pairs	Policy status
3rd party export restriction	C2 with Export to Third Party	Disabled
Restrict data export	C12 with Data Export	Disabled
Restrict email targeting	C4, C5 with Email Targeting	Disabled

KEY IDEA

Adobe ships its governance policies written but Disabled. A perfectly labelled schema protects nothing until someone enables the right policy.

Tara signs, then Bloom switches it on

- Decision owner: Tara, legal and privacy
- Policy: 3rd party export restriction
- Pairs label C2 with Export to Third Party
- Read the warning before you confirm
- Practising? Never enable one in a shared sandbox

KEY IDEA

Bloom enabled one shipped policy, 3rd party export restriction, only after Tara signed it, because enabling a policy changes behaviour for everyone.

Activate, and get blocked on purpose

KEY IDEA

At activation, AEP checks every mapped field's labels against enabled policies for the destination's marketing actions. A match blocks and names all three.

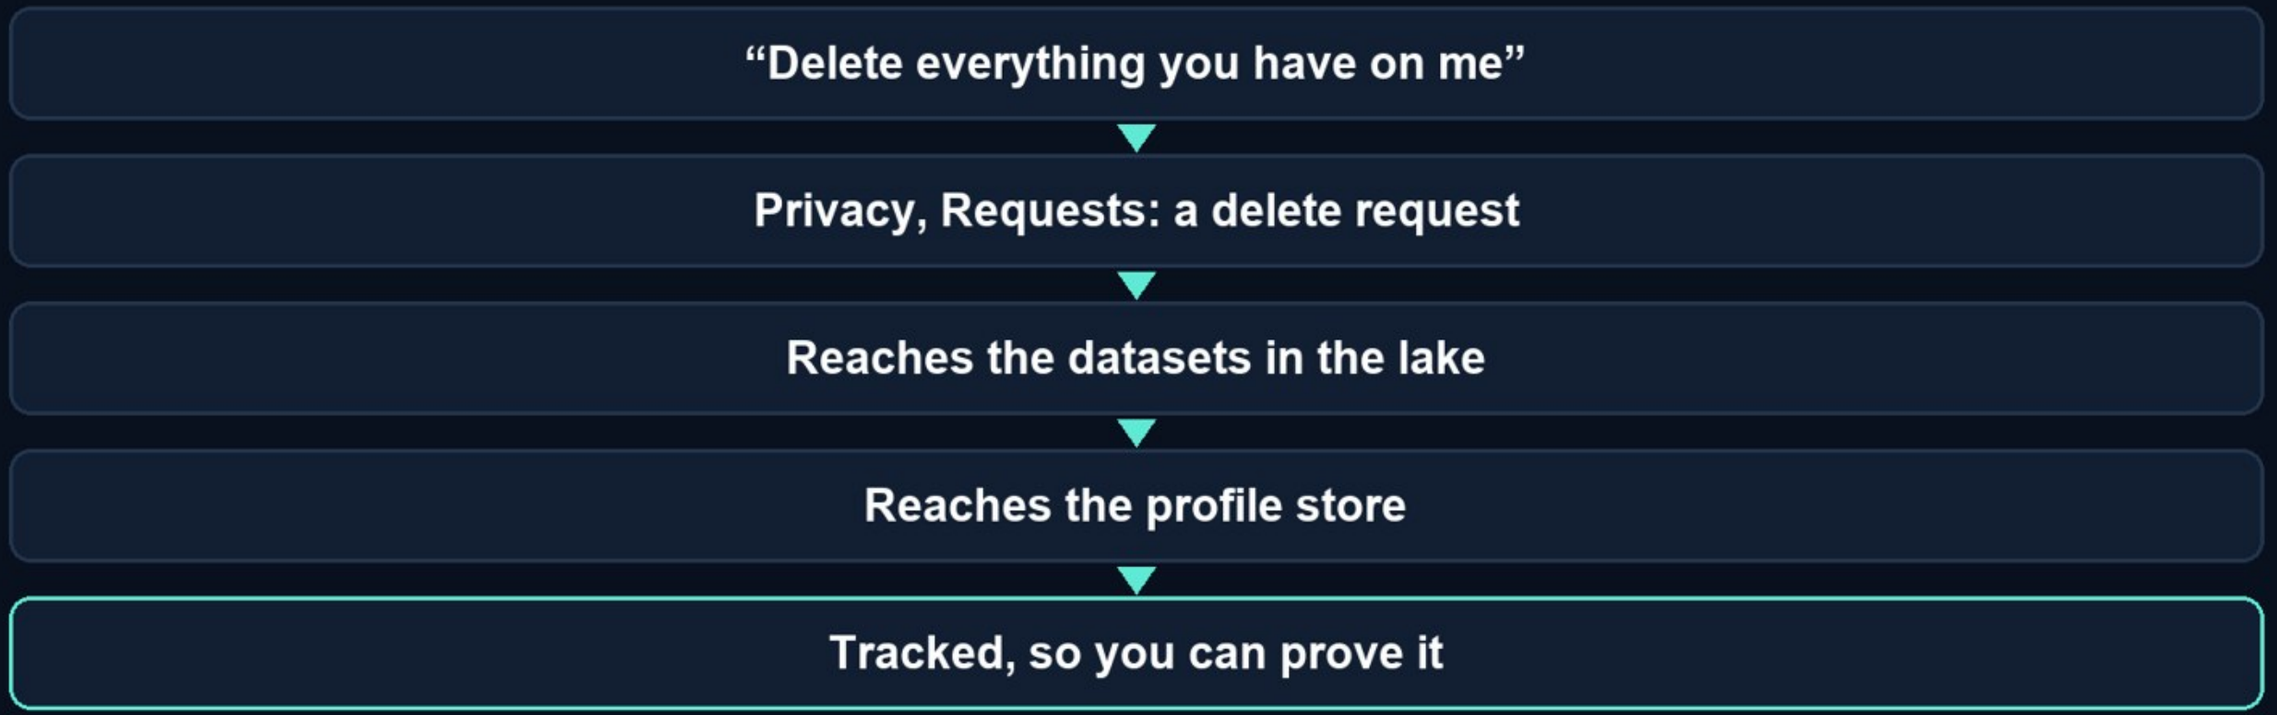

The fix, and the fixes you must not use

Option	Verdict
Remove phone from the mapping	Right: the minimum the agency needs
Choose a compliant destination	Right, if the use is genuinely allowed
Delete the C2 label	Wrong: hides the truth about the data
Disable the policy for a day	Wrong: switches the wall off for all

KEY IDEA

Remove the restricted field, or choose a compliant destination. Never delete the label or disable the policy just to make an activation go green.

Privacy requests: delete means everywhere

KEY IDEA

Access and delete requests run through Privacy Service. They reach the datasets and the profile store and are tracked, so you can prove what was done.

Tara's habits: consent and five questions

- Which fields carry contract limits, from which contract?
- Which marketing actions do we perform today?
- Which policies must therefore be enabled?
- Who may enable or disable a policy?
- Who handles an activation when it is blocked?

KEY IDEA

Consent is a state with a source, a timestamp, a scope and a lifecycle. Governance's real deliverable is five questions, each with a named owner.

Interview corner

- “I have configured data usage policies
- and watched them block a bad export.”
- Labels describe, actions intend, policies enforce
- Shipped policies are Disabled; enabling needs an owner
- Deletion is a tracked privacy request

KEY IDEA

“I have configured data usage policies and watched them block a bad export.” Say it once it is true in your own sandbox.

Recap, your question, and three landmines

- One sentence: label, marketing action, policy
- Shipped policies are Disabled; give them an owner
- Blocked? Remove the field, never the rule
- Privacy requests reach the lake and the profile
- Next: Platform APIs, three landmines, the RCA

KEY IDEA

Labels describe, actions intend, enabled policies enforce, and deletion reaches the lake and the profile. Next: three landmines the previous consultants left.
